VM-FEX gives you the option to bypass the vSwitch embedded on each ESXi host (VEM) for example. With VM-FEX you see the VMs as if they were directly connected to the Parent switch (N7K/5K for example), making the parent switch responsible for the management (cause there is no vSwitch in the middle anymore).

The hypervisor typically presents a virtual network interface to each VM and performs Layer 2 switching of traffic from a VM to other local VMs or to a physical interface to the external network. Working with a Cisco virtual interface card (VIC) adapter, Cisco Virtual Machine Fabric Extender (VM-FEX) bypasses software-based switching of VM traffic by the hypervisor in favor of external hardware-based switching in the fabric interconnect.
