Andy Lansell, killed in the First World War in 1918, lies in a small cemetery in the north of France. Henry Lyon, in a borrowed Volvo station wagon, is driving up to the south coast of New South Wales. The paths of their lives are about to cross. From this award-winning and best-selling author comes a story of two young men. As Andy and his mates head inexorably towards the bloody, torturous Western Front, Henry and his mates face challenges, dangerous situations and tragedies of their own. Now published in 2014 as an Anzac Centenary Edition with a Preface from the author to mark one hundred years since the commencement of World War I. 'Metzthen gets better all the time.' Kipp Herreid learned other ways to teach- much better ways. His favorite approach puts science in vivid context through case studies, which he calls "stories with an educational message." This compilation of 40-plus essays examines every aspect of the case study method.--[back cover].

Increasing scientific evidence suggests that the majority of diseases including cancer are driven by oxidative stress and inflammation, attributed to environmental factors. These factors either drive genetic mutations or epigenetically modify expression of key regulatory genes. These changes can occur as early as gestational fetal development, and major questions remain as to how dietary/nutritional phytochemical factors biochemically interact with such genetic and epigenetic events. With chapters written by international experts, *Inflammation, Oxidative Stress, and Cancer: Dietary Approaches for*

Cancer Prevention examines the latest developments on the effects of various dietary phytochemicals. Divided into nine sections, the book begins with the basic mechanisms of inflammation/oxidative stress-driven cancer, including an overview of the topic and how to prevent carcinogenesis, the role of obesity in inflammation and cancer, and antioxidant properties of some common dietary phytochemicals. Subsequent sections cover cellular signal transduction, molecular targets, and biomarkers of dietary cancer-preventive phytochemicals, as well as their potential challenges with in vivo absorption and pharmacokinetics. The chapters also examine the cancer-preventive properties of various classes of phytochemicals, including vitamins A, D, and E; omega-3 and omega-6 fatty acids; flavanoids and polyphenols; garlic organosulfur compounds and cruciferous glucosinolates; and selenium, traditional Chinese herbal medicines, and alpha lipoic acid. The final section of the book explores the latest developments on the interactions of dietary phytochemicals through epigenetics and the management of chronic inflammation with nutritional phytochemicals.

Revolutionizing Women's Healthcare is the story of a feminist experiment: the self-help movement. This movement arose out of women's frustration, anger, and fear for their health. Tired of visiting doctors who saw them as silly little girls, suffering shame when they asked for birth control, seeking abortions in back alleys, and holding little control over their own reproductive lives, women took action. Feminists created "self-help groups" where they examined each other's bodies and read medical literature. They founded and ran clinics, wrote books, made movies, undertook nationwide tours, and raided and picketed offending medical institutions. Some performed their own abortions. Others swore off pharmaceuticals during menopause. Lesbian women found "at home" ways to get pregnant. Black women used self-help to talk about how systemic racism affected their health. Hannah Dudley-Shotwell engagingly chronicles these stories and more to showcase the creative ways women came together to do for themselves what the mainstream healthcare system refused to do.

Hormone replacement is clearly indicated for the prevention and treatment of osteoporosis. Although its importance in treating this disease is no longer questioned, much remains to be fully understood about its effective application in practice. Drug Therapy for Osteoporosis examines what is known about the progress of osteoporosis and describes the impact of hormone replacement therapy. The author reviews the option for using SERMs as opposed to conventional HRT regimens, discusses not only the effectiveness of treatment but also the recommended duration, and provides clear guidelines on the laboratory evaluation of osteoporosis.

Interest in the role of extracellular vesicles (microvesicles and exosomes) is expanding rapidly. It is now apparent that far from being merely cellular debris, these vesicles play a key role in cell-to-cell communication and signaling. Moreover, they are significantly elevated in a number of diseases. This raises the question of their direct role in pathogenesis as well as their possible use as biomarkers. This book stems from the first international meeting on "Microvesicles and Nanovesicles in Health and Disease" held at Magdalen College, Oxford, in 2010. The purpose of the meeting was to bring together, for the first time, a range of experts from around the world to discuss the latest advances in this field. Key to the study of these vesicles is the availability of methodologies for their measurement in biological fluids. A major section of the meeting focused on a range of exciting new technologies which have been developed for this purpose. The presentations at this meeting form the basis of this book, which will appeal to basic scientists, clinicians, and those developing technology for the measurement of extracellular vesicles.
